

l'import du GLB

```
import { GLTFLoader } from 'three/examples/jsm/loaders/GLTFLoader.js'

const loaderGlb = new GLTFLoader()

export default async function loadAssets(path) {

  const glb = await loaderGlb.loadAsync(path)

  const visuals = []

  const colliders = []

  const players = []

  for( const mesh of glb.scene.children){

    const name = mesh.name

    if(name.includes('visual')) {

      visuals.push(mesh)

    }else if(name.includes('collider')) {

      colliders.push(mesh)

    }else if(name.includes('player')) {

      players.push(mesh)

    }

  }

  return {visuals, colliders, players}

}
```

La class

```

import { Object3D } from "three";

export default class Player extends Object3D {

  constructor(mesh) {

    super()

    this.position.copy(mesh.position)

    this.initPhysic()

    this.initVisual(mesh)

  }

  initPhysic() {

  }

  initVisual(mesh) {

    mesh.position.set(0,0,0)

    mesh.castShadow = true

    this.add(mesh)

  }

}

```

et dans app

```

const world = new World(meshes.visuals)

```

```
const player = new Player(meshes.players[0])
```
